Image 2

- To generate candidate matches, find patches that have the most similar appearance (e.g., lowest SSD)
- Simplest approach: compare them all, take the closest (or closest k , or within a thresholded distance)

Indexing local features

Scalable
Recognition
with a
Vocabulary
Tree

Srikumar
Ramalingam

Problem
Statement

Bag of
Features

Building the
Vocabulary
Tree

- Each patch / region has a descriptor, which is a point in some high-dimensional feature space (e.g., SIFT)

Indexing local features

Scalable
Recognition
with a
Vocabulary
Tree

Srikumar
Ramalingam

Problem
Statement

Bag of
Features

Building the
Vocabulary
Tree

- When we see close points in feature space, we have similar descriptors, which indicates similar local content.

Indexing local features

Scalable
Recognition
with a
Vocabulary
Tree

Srikumar
Ramalingam

Problem
Statement

Bag of
Features

Building the
Vocabulary
Tree

- With potentially thousands of features per image, and hundreds to millions of images to search, how to efficiently find those that are relevant to a new image?

Problem Statement

Scalable Recognition with a Vocabulary Tree

Scalable

bourne/im1000051094.pgm

- An image matching scheme that scales efficiently to a large number of objects is presented.
- Robust indexing of local image descriptors with respect to background clutter and occlusion.
- The local region descriptors are hierarchically quantized in a vocabulary tree.

Problem
Statement

Bag of
Features

Building the
Vocabulary
Tree

A document (datapoint) is a vector of counts over each word (feature)

$$\mathbf{v}_d = [n(w_{1,d}) \quad n(w_{2,d}) \quad \cdots \quad n(w_{T,d})]$$

$n(\cdot)$ counts the number of occurrences

just a histogram over words

What is the similarity between two documents?

Building the
Vocabulary
Tree

A document (datapoint) is a vector of counts over each word (feature)

$$\mathbf{v}_d = [n(w_{1,d}) \quad n(w_{2,d}) \quad \cdots \quad n(w_{T,d})]$$

$n(\cdot)$ counts the number of occurrences

just a histogram over words

What is the similarity between two documents?

Use any distance you want but the cosine distance is fast.

$$\begin{aligned} d(\mathbf{v}_i, \mathbf{v}_j) &= \cos \theta \\ &= \frac{\mathbf{v}_i \cdot \mathbf{v}_j}{\|\mathbf{v}_i\| \|\mathbf{v}_j\|} \end{aligned}$$

Tree

- Summarize entire image based on its distribution (histogram) of word occurrences.
- Analogous to bag of words representation commonly used for documents.

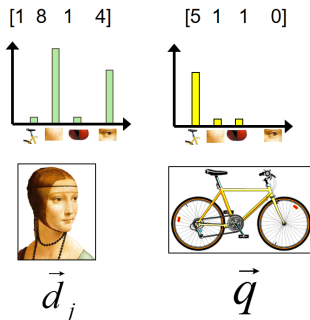

Comparing bag of words

Scalable
Recognition
with a
Vocabulary
Tree

Srikumar
Ramalingam

- Rank frames by normalized scalar product between their (possibly weighted) occurrence counts---*nearest neighbor* search for similar images.

$$\text{sim}(d_j, q) = \frac{\langle d_j, q \rangle}{\|d_j\| \|q\|}$$

$$= \frac{\sum_{i=1}^V d_j(i) * q(i)}{\sqrt{\sum_{i=1}^V d_j(i)^2} * \sqrt{\sum_{i=1}^V q(i)^2}}$$

for vocabulary of V words

tf-idf weighting

- **Term frequency – inverse document frequency**
- Describe frame by frequency of each word within it, downweight words that appear often in the database
- (Standard weighting for text retrieval)

Number of occurrences of word i in document d

$$t_i = \frac{n_{id}}{n_d} \log \frac{N}{n_i}$$

Total number of documents in database

Number of words in document d

Number of documents word i occurs in, in whole database

K-means Clustering

Given k :

1. Select initial centroids at random.
2. Assign each object to the cluster with the nearest centroid.
3. Compute each centroid as the mean of the objects assigned to it.
4. Repeat previous 2 steps until no change.

Clustering and Vector Quantization

Scalable
Recognition
with a
Vocabulary
Tree

Srikumar
Ramalingam

Problem
Statement

Bag of
Features

Building the
Vocabulary
Tree

- Clustering is a common method for learning a visual vocabulary or codebook
 - Unsupervised learning process
 - Each cluster center produced by k-means becomes a codevector
 - Codebook can be learned on separate training set
 - Provided the training set is sufficiently representative, the codebook will be “universal”
- The codebook is used for quantizing features
 - A *vector quantizer* takes a feature vector and maps it to the index of the nearest codevector in a codebook
 - Codebook = visual vocabulary
 - Codevector = visual word

Problem
Statement

Bag of
Features

Building the
Vocabulary
Tree

- An illustration of the process of building the vocabulary tree. The hierarchical quantization is defined at each level by k centers (in this case $k = 3$) and their Voronoi regions.

Building the Vocabulary Tree

Scalable
Recognition
with a
Vocabulary
Tree

Srikumar
Ramalingam

Problem
Statement

Bag of
Features

Building the
Vocabulary
Tree

- The vocabulary tree is built by hierarchical k-means clustering.
- Descriptor vectors are used in the unsupervised training.
- First, an initial k-means process is run to define k cluster centers.
- The training data is then partitioned into k groups, where each group consists of the descriptor vectors closest to a particular cluster center.
- The same process is then recursively applied to each group of descriptor vectors, recursively defining quantization cells by splitting each quantization cell into k new parts.
